1. Hardware and Software requirements

1.1 Hardware requirements

- Personal Computer with Pentium III processor
- Minimum RAM memory 1GB, recommended 2GB
- Resolution 1024 x 768
- 32 bit Color
- CD-ROM reader
- Mouse

1.2 Software requirements

- Windows XP Service Pack 2 or higher
- Microsoft.NET Framework 3.5 Service Pack 1

2. Fundamental concepts

NOTE: in case of Lighting Management, only the automation function is managed.

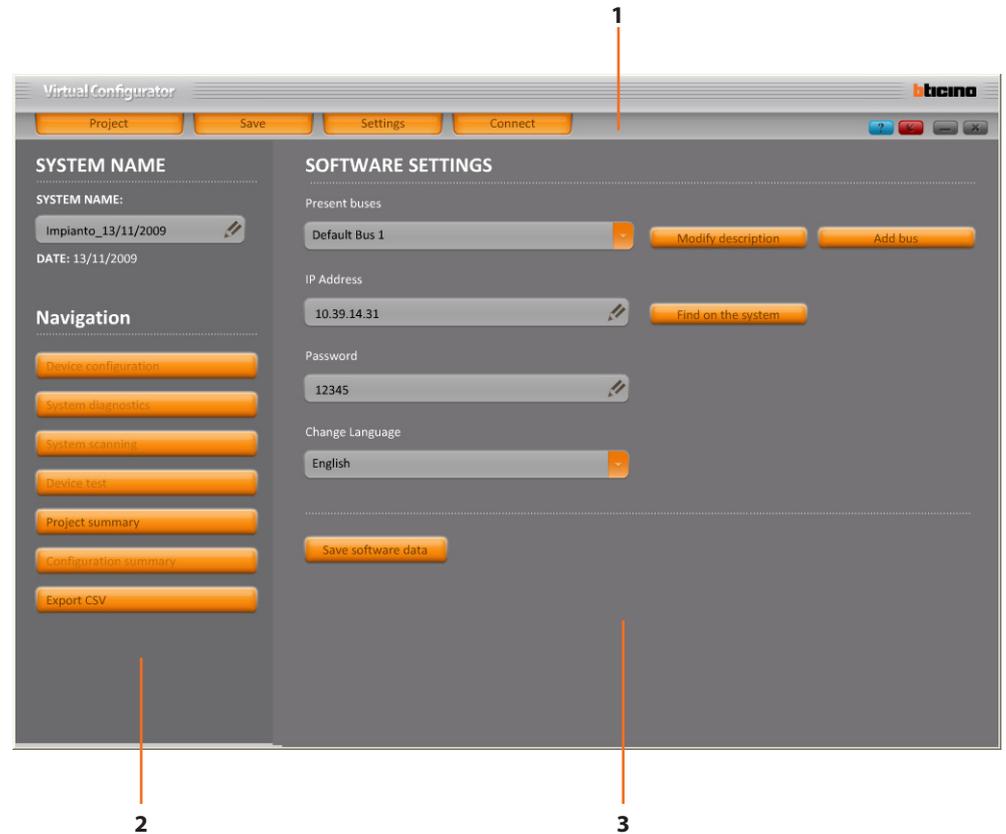

The main functions of Virtual Configurator are:

- downloading the project to the system
- if used in local mode, perform a system scan, once this has been configured for subsequent system maintenance.

The software can be used to manage the Automation and Temperature control functions.

2.1 Workstation

Virtual Configurator has a simple and intuitive interface, consisting of three areas:

1. The control bar, including the general program controls and the connection status indicator
2. The left area, where the navigation controls can be found
3. The main area, with the specific controls and information for the function selected

When the program is started, the window shows the **Settings** menu as active. At this stage network connection has not yet been established (the connection status icon  is red), and only navigation, **Project Summary**, and **Export CSV** file are enabled

Click **Modify description** to open the **Change bus name** window, where you can enter a new name for the bus.

Create new bus

Description

...

IP address: 192.168.1.35

Password: 12345

Save Cancel

Click Add bus to open the **Create new bus** window, from which it will be possible to change the bus description, the IP address, and the password.

Research result

Device description	BMNE500
User description	BMNE500 device
IP address	10.39.13.238
MAC address:	00-03-50-00-1D-08

It is necessary to insert a password

11111

1/12

Use the device Cancel

Click Research on system to open the **Research result** window, where it will be possible to display the devices currently on the system.

NOTE: in order to use this function, it will be necessary to activate the UPnP services that can be installed from the Windows control panel

Lastly, clicking **Save software data** will save the IP address, password, and language settings, and will also activate the connection to the system, giving access to all software functions.

2.2 The general controls

The control bar provides the following functions:

- **New** - create a new project
- **Open** - open an existing project
- **Save** - save the current project
- **Save as** - save the current project asking for a file name

Save the current project

This menu can be used to customise the base software settings; to confirm any changes made, press **Save software data** before exiting the menu. The Settings menu is active even if the system is not connected to the Web Server, in order to allow the IP Address and the connection password to be changed

Activate the connection to the system

Change language

The **Change language** window menu can be used for selecting the language to be used when communicating with the software

IP address

The program has already been set at the factory with the base BTicino Web Server IP Address 192.168.135; if the BTicino Web Server IP address has been changed, the new number must be known and entered in this field in order to establish connection

Password

The program has already been set at the factory with the base BTicino Web Server password 12345; If the password has been changed, the new password must be known and entered in this field in order to establish connection

3. Device configuration

Configuration is possible on systems on which devices accepting advanced configuration are installed. The software can be used to configure both devices already configured virtually, and devices which address is not known.

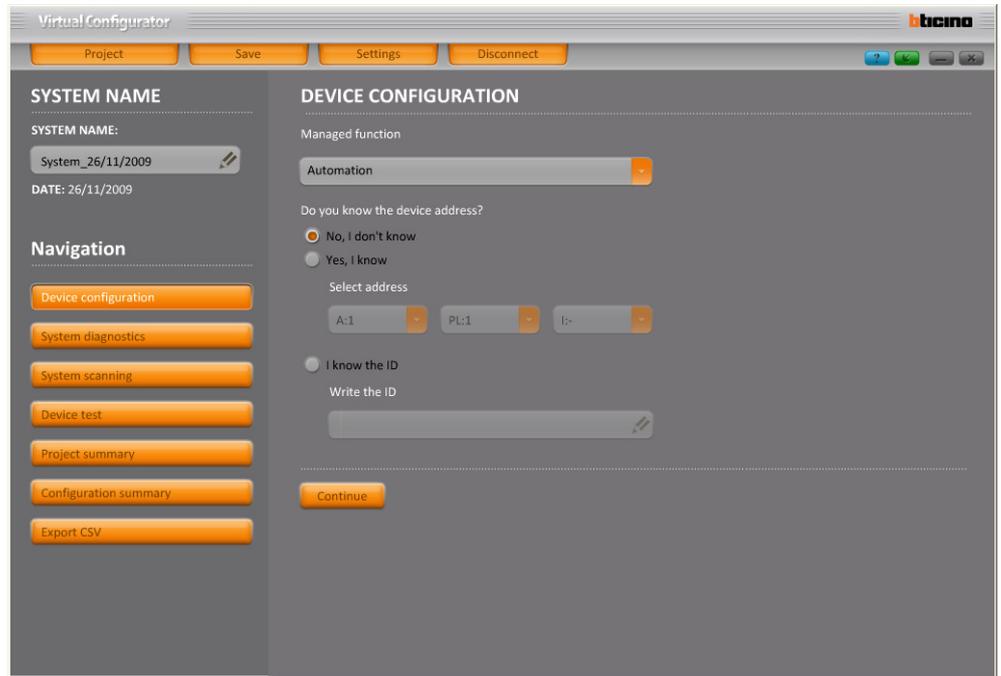

The screenshot shows the 'Virtual Configurator' application window. The top menu bar includes 'Project', 'Save', 'Settings', and 'Disconnect'. The main interface is divided into two panels. The left panel, titled 'SYSTEM NAME', contains a text field for 'SYSTEM NAME' (with 'System_26/11/2009' entered), a 'DATE' field (with '26/11/2009' entered), and a 'Navigation' sidebar with buttons for 'Device configuration', 'System diagnostics', 'System scanning', 'Device test', 'Project summary', 'Configuration summary', and 'Export CSV'. The right panel, titled 'DEVICE CONFIGURATION', has a 'Managed function' dropdown menu set to 'Automation'. Below it, a question 'Do you know the device address?' is followed by two radio button options: 'No, I don't know' (selected) and 'Yes, I know'. Under 'No, I don't know', there is a 'Select address' section with three dropdown menus for 'A:1', 'PL:1', and 'I:-'. Under 'Yes, I know', there is a 'Write the ID' text input field. A 'Continue' button is located at the bottom of the right panel.

Enter the IP address and the password, if different from the default ones; click **Save software data**. Then click **Device configuration**. The following window will appear, where it will be possible to:

- select the function to manage (Automation or Temperature control)
- select one of the following options:
 - **Yes, I know** (the address)
 - **No, I don't know** (the address)
 - **I know the ID** (this option can only be selected when managing the Automation function)
- enter the address, if known
- enter the ID, if known

This is an identical screenshot to the one above, showing the 'Virtual Configurator' application window with the 'DEVICE CONFIGURATION' panel. The 'Managed function' is 'Automation', and the 'Do you know the device address?' option 'No, I don't know' is selected. The 'Select address' dropdowns are set to 'A:1', 'PL:1', and 'I:-'. The 'Continue' button is visible at the bottom.

3.1 Automation Function

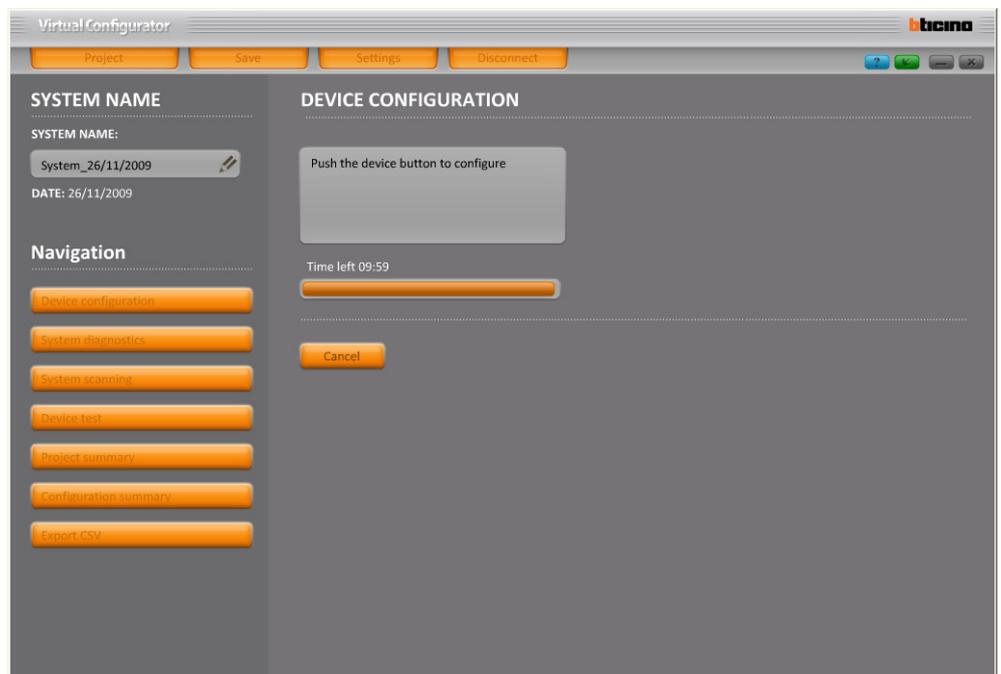

In this window, first of all select one of the following options:

- **no, I don't know** (the address)
- **yes, I know** (the address)
- **I know the ID**

3.1.1 Configuring a device with unknown address

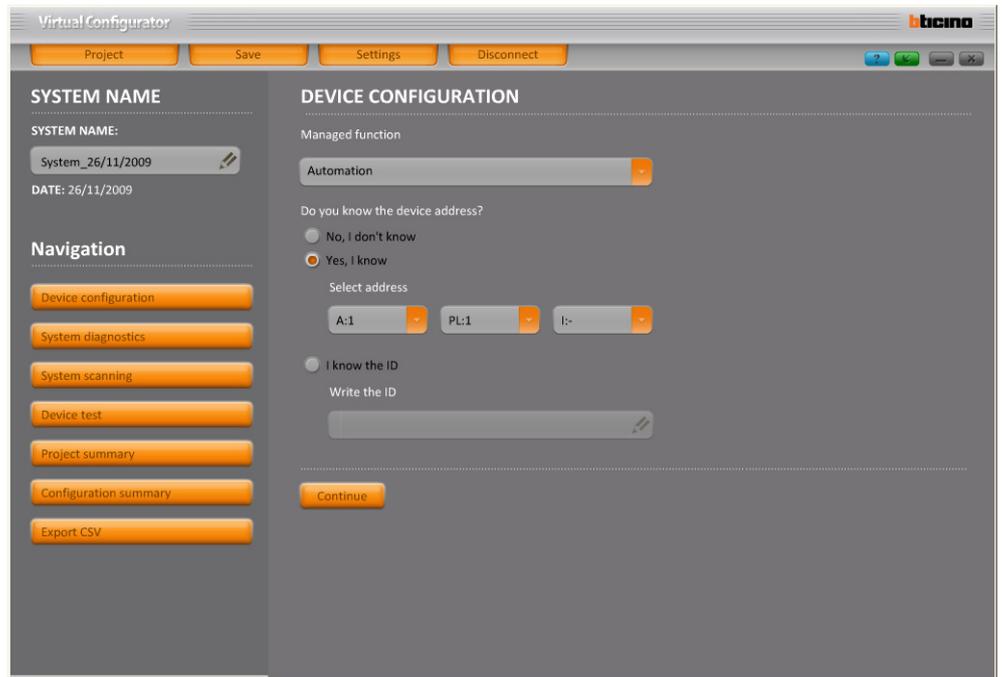

When configuring a device which address is unknown, select the option **No, I don't know**.

Click **Continue**. The following window will open, where the user will be asked to press a key of the device to be configured within 10 minutes. If this is not done, after 10 minutes an error message will be displayed.

3.1.2 Configuring a device with known address

To configure a device which address is known select **Yes, I know**. This will activate the configuration keys.

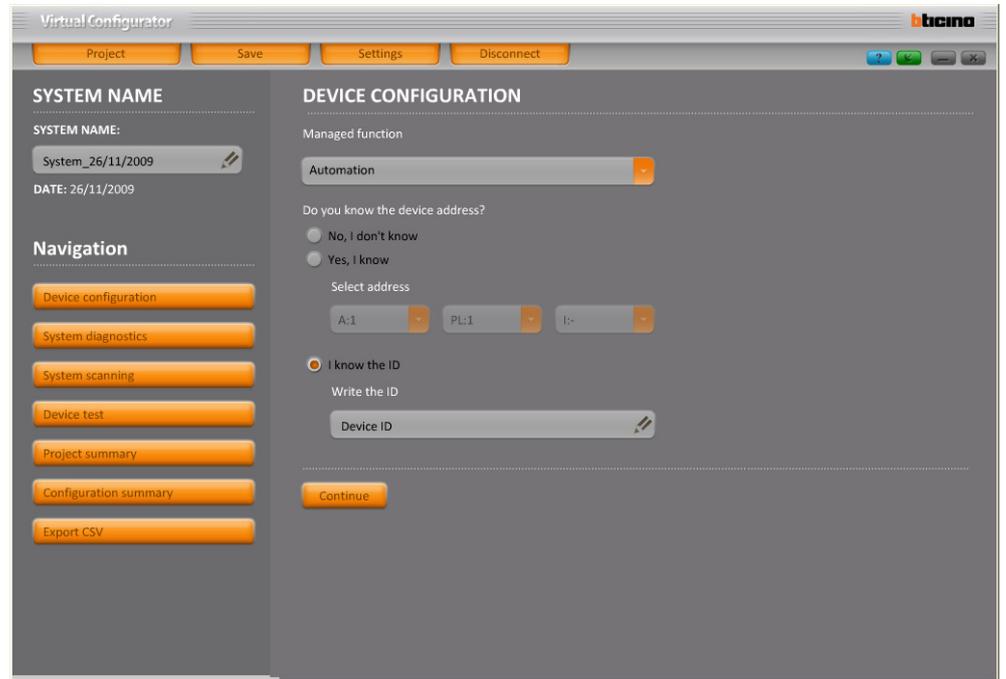

Use the menus of the configurators to enter the current configuration of the device to be reconfigured.

Configurator I refers to the logic expansion interface. It must only be configured if the device is beyond the logic expansion interface.

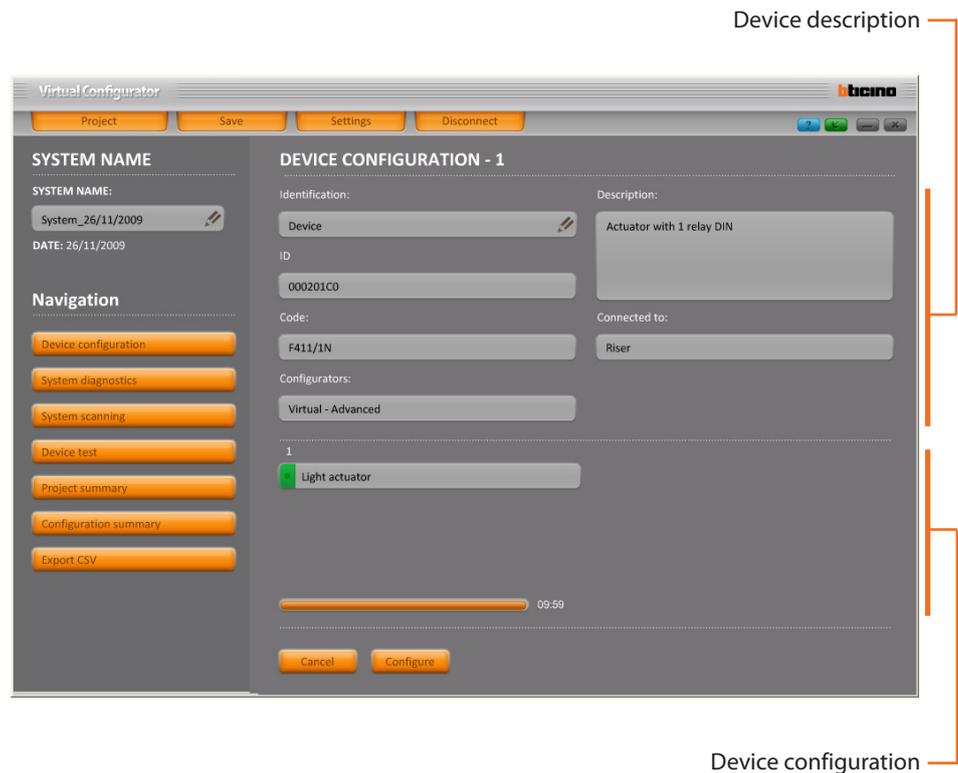

3.1.3 Configuring a device with known ID

To configure a device when the ID is known, select the option **I know the ID**. This will activate the field **Write the ID**, so that the user can enter the ID.

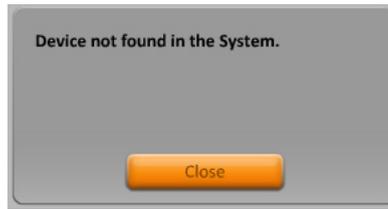

Now, in order to initiate the device identification procedure, both if the ID is known, and if the address is known, click **Continue**.

The following window will open, showing the full description and the corresponding configuration of the identified device.

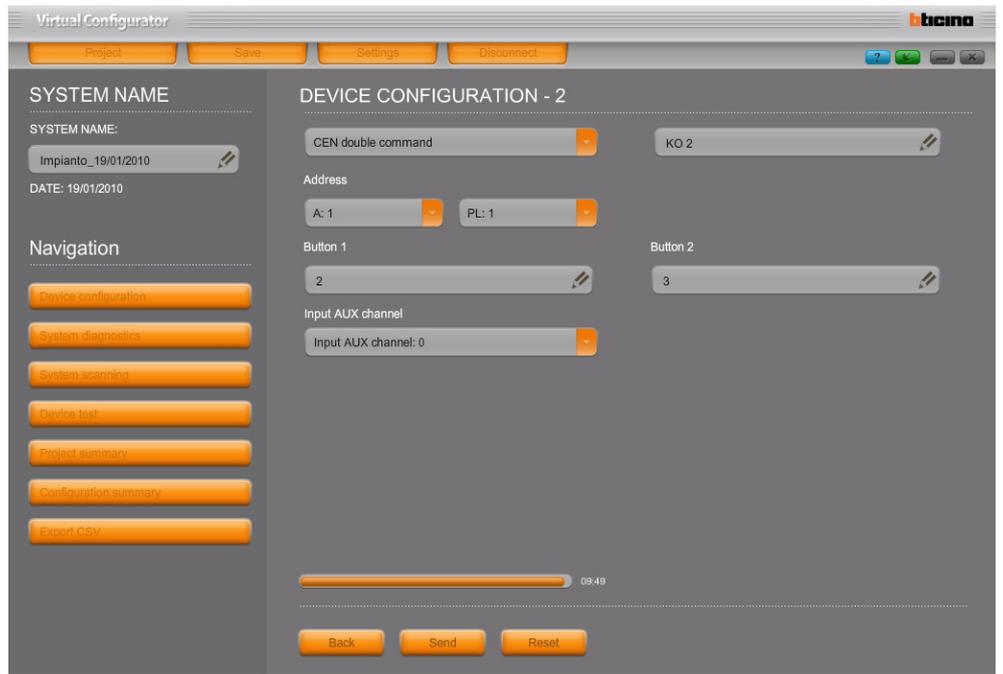

NOTE: if the device is not present, a warning message is displayed.

If a green icon appears by the side of the device name, click the icon with the right mouse button to change/delete the device configuration.

In this case, the values shown are those of the actual device configuration.

To complete the parameter changing procedure click the following icons:

IMPORTANT: to save any changes made to the configuration, it is not enough to use the Send and Reset functions; it will be necessary to return to the previous page and click Configure.

Return to the previous window without saving the changes to the configuration

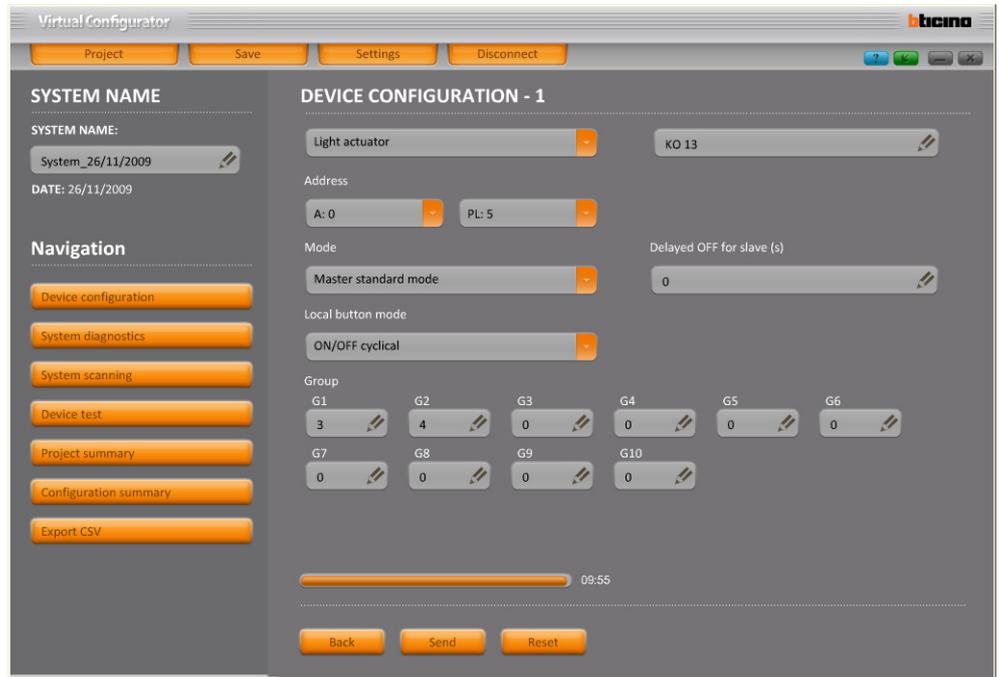

Send the data to the device and return to the previous window

Cancel the current configuration

If a yellow icon appears by the side of the device name, click the icon with the right mouse button to open the following window, where it will be possible to change the device configuration

In this case the values shown are the default values.

To complete the parameter changing procedure click the following icons:

IMPORTANT: to save any changes made to the configuration, it is not enough to use the Send and Reset functions; it will be necessary to return to the previous page and click **Configure**.

Return to the previous window without saving the changes to the configuration

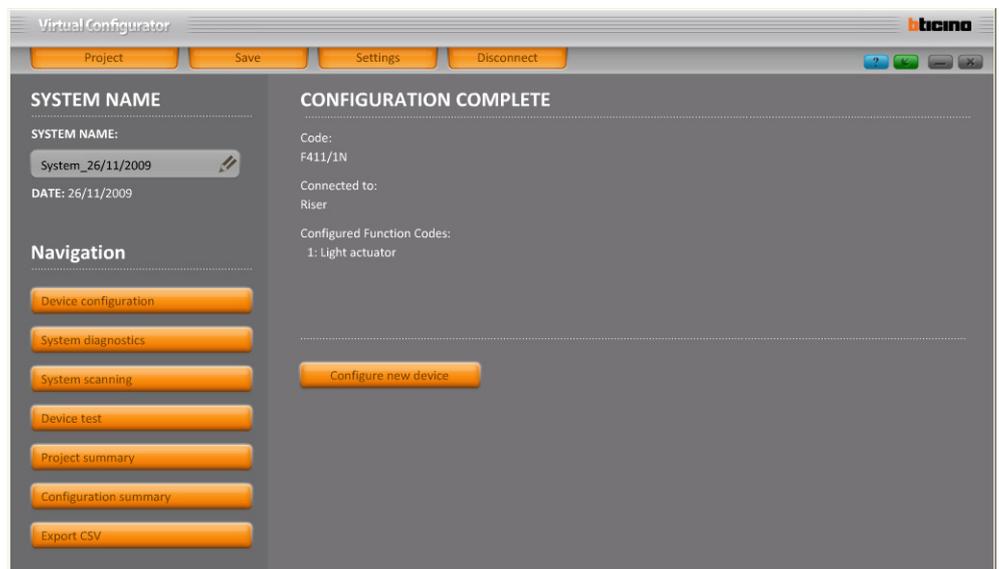

Send the data to the device and return to the previous window

Cancel the current configuration

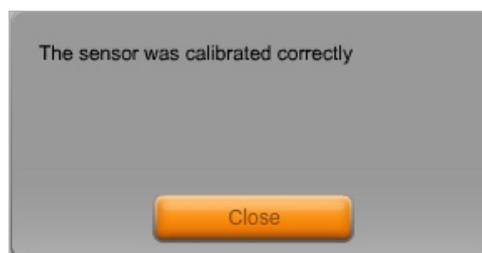

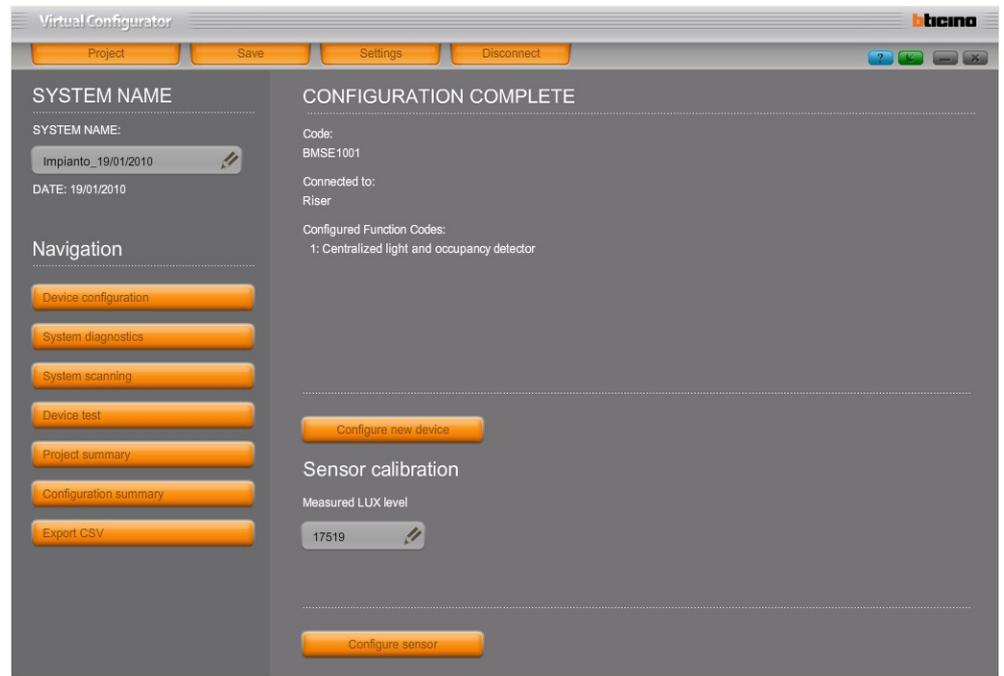

The following window will now be displayed. Click **Configure new device** to configure another device

3.1.4 When the device being configured is a detector

If the device being configured is a detector, follow the same procedure as for the actuators, previously described.

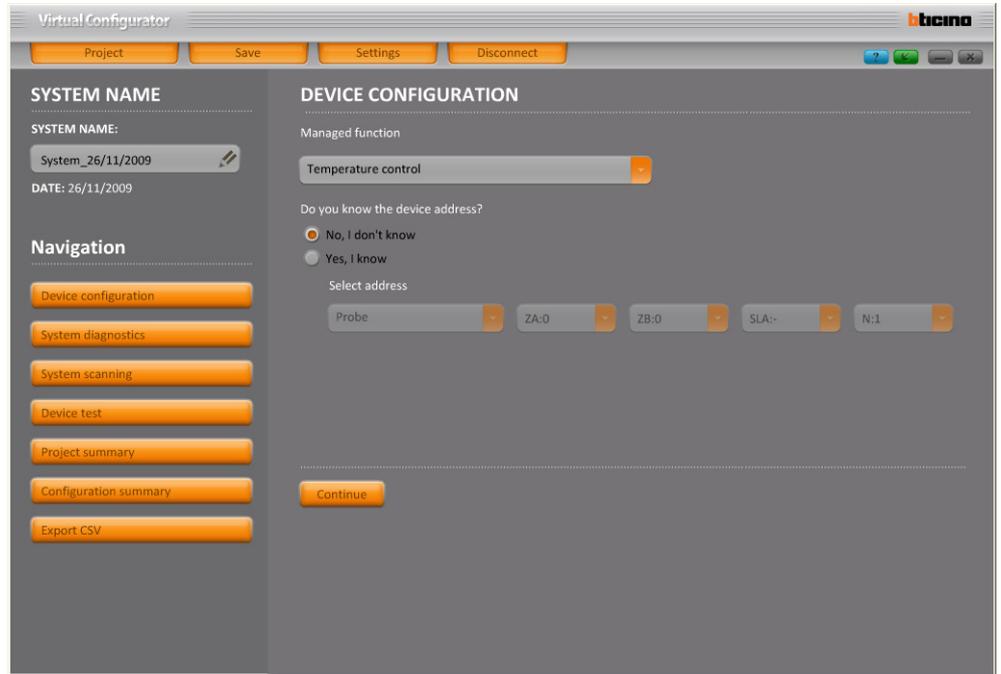

The only difference is that when **Configure** is clicked, the following window will appear, where the measured lux level must be entered in the detector calibration sector.

To configure the detector click **Configure detector**. A message will appear, confirming the correct calibration of the same.

Click **Close** to continue.

3.2 Temperature control Function

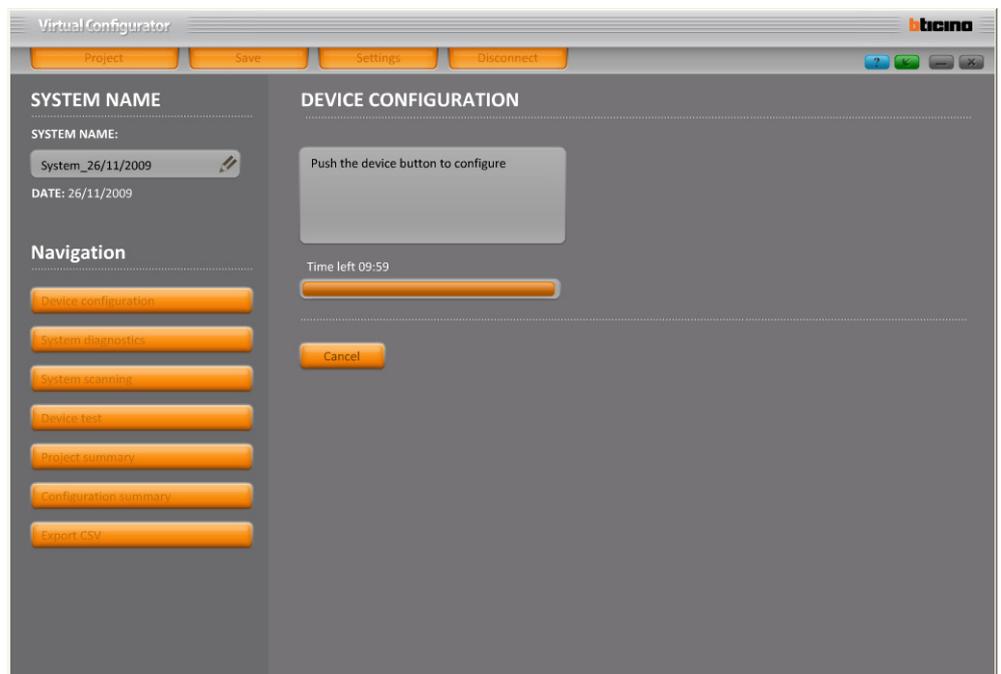

In this window, first of all select one of the following options:

- **no, I don't know** (the address)
- **yes, I know** (the address)

3.2.1 Configuring a device with unknown address

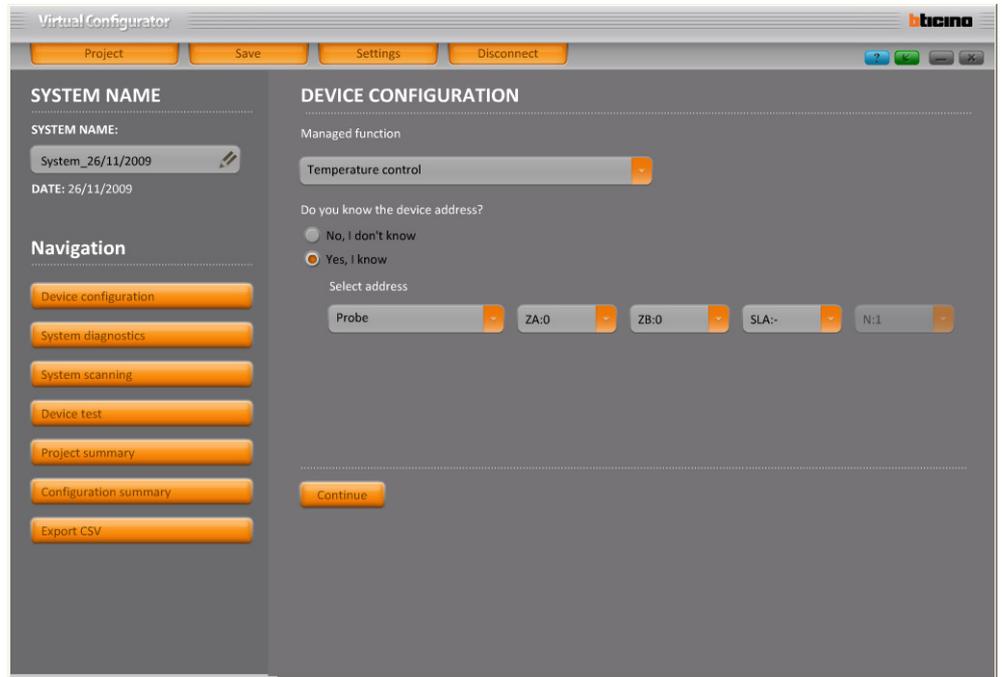

When configuring a device which address is unknown, select the option **No, I don't know**.

Click **Continue**. The following window will open, where the user will be asked to press a key of the device to be configured within 10 minutes. If this is not done, after 10 minutes an error message will be displayed.

3.2.2 Configuring a device with known address

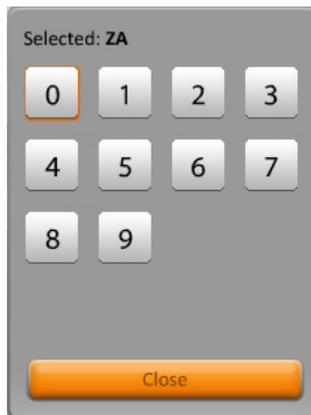

To configure a device when the current configuration is known select **Yes, I know**. This will activate the configuration keys.

Use the menus of the configurators to enter the current configuration of the device to be reconfigured.

NOTE: the menu of the SLA configurator only becomes active if the device which address is known is a PROBE, while the menu of the N configurator only becomes active if the device which address is known is a GATEWAY or an ACTUATOR.

Now click **Continue** to initiate the procedure for the identification of the device on the system.

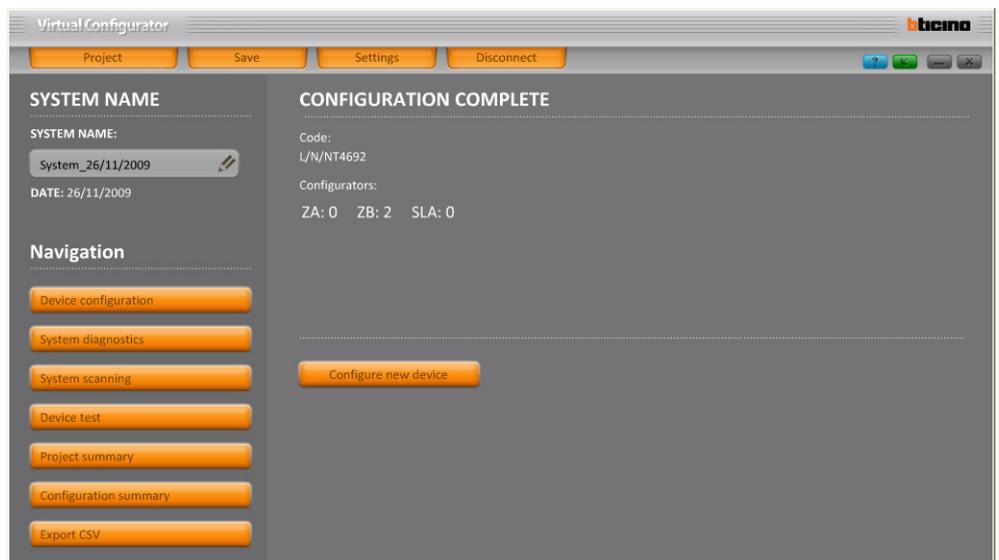

The following window will open, showing the full description and the corresponding configuration of the identified device.

NOTE: if the device is not present, a warning message is be displayed.

Click **Configure** to configure the device. The following window will open. Click **Configure new device** to configure another device.

4. System diagnostics

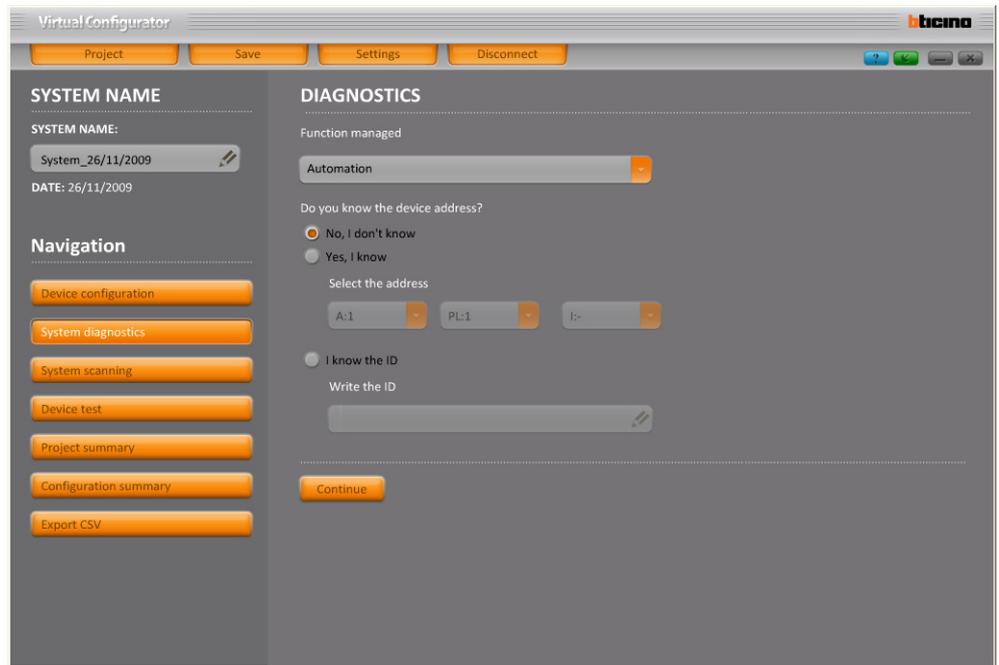

Virtual Configurator can be used to check the operation of the devices connected to the system. To access system diagnostics section click **System Diagnostics**.

The following window will open, where it will be possible to:

- select the function to be managed (Automation or Temperature control)
- select one of the following options:
 - **Yes, I know** (the address)
 - **No, I don't know** (the address)
 - **I know the ID** (this option can only be selected when managing the Automation function)
- - enter the address, if known
- - enter the ID, if known

The screenshot shows the 'Virtual Configurator' interface. At the top, there are buttons for 'Project', 'Save', 'Settings', and 'Disconnect'. The main area is divided into two sections: 'SYSTEM NAME' and 'DIAGNOSTICS'.
In the 'SYSTEM NAME' section, the 'SYSTEM NAME' is 'System_26/11/2009' and the 'DATE' is '26/11/2009'. Below this is a 'Navigation' sidebar with buttons for 'Device configuration', 'System diagnostics' (which is highlighted), 'System scanning', 'Device test', 'Project summary', 'Configuration summary', and 'Export CSV'.
The 'DIAGNOSTICS' section has a 'Function managed' dropdown set to 'Temperature control'. Below it, there are radio buttons for 'Do you know the device address?': 'No, I don't know' (selected) and 'Yes, I know'. Under 'Select the address', there are five dropdown menus: 'Probe', 'ZA:0', 'ZB:0', 'SLA:-', and 'N:1'. A 'Continue' button is located at the bottom of the 'DIAGNOSTICS' section.

4.1 Automation Function

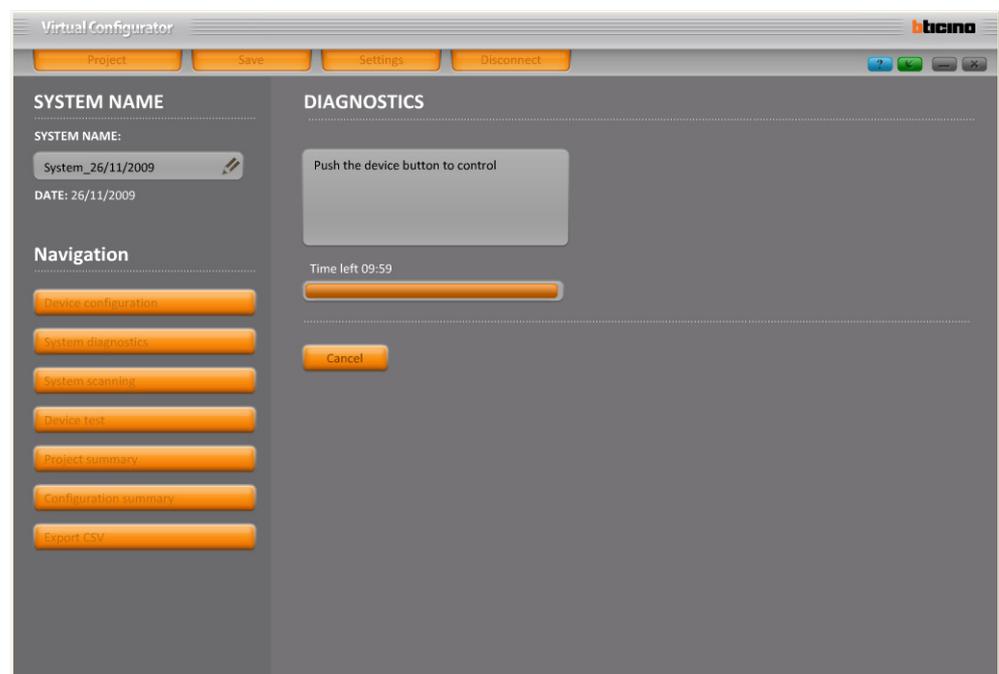

In this window, first of all select one of the following options:

- **no, I don't know** (the address)
- **yes, I know** (the address)
- **I know the ID**

4.1.1 When the device address is unknown

To perform the diagnostic procedure on a device which address is unknown, select the option **No, I don't know**.

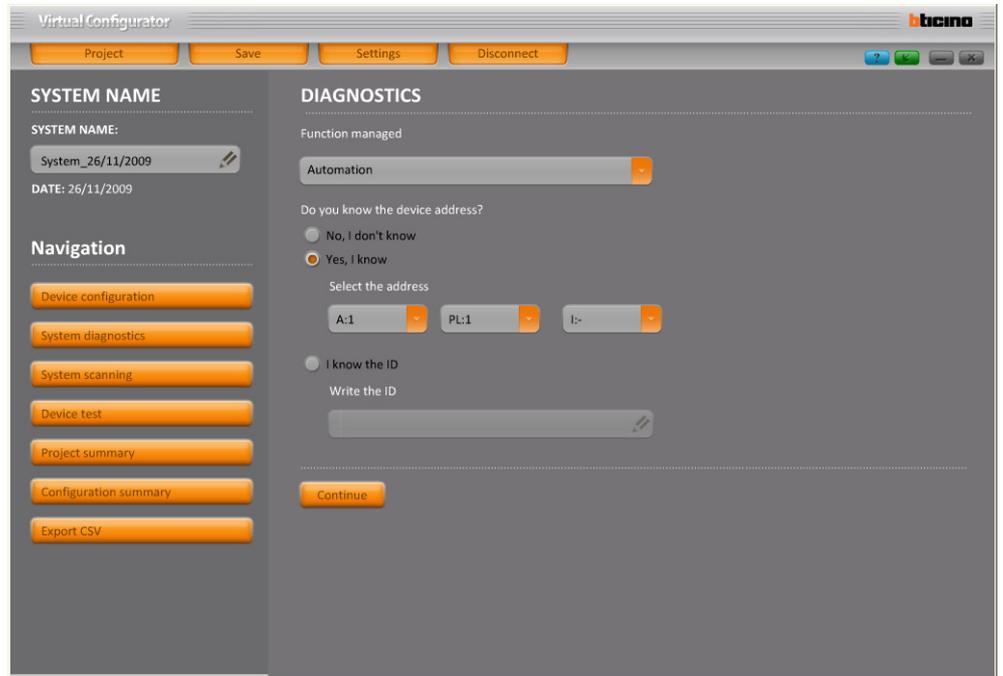

Click **Continue**. The following window will open, where the user will be asked to press a device key within 10 minutes. If this is not done, after 10 minutes an error message will be displayed.

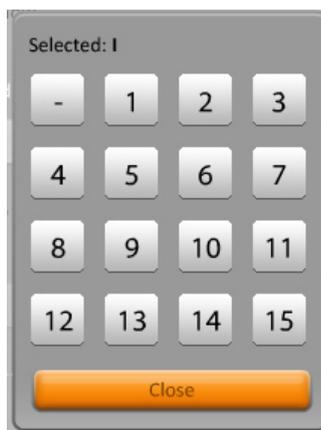

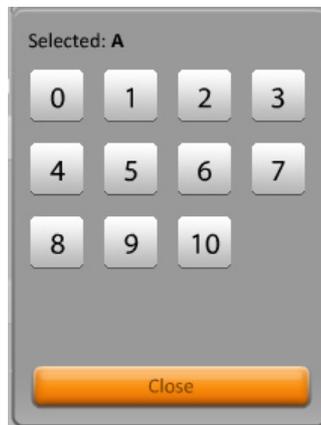

4.1.2 When the device address is known

To perform the diagnostic procedure on a device which address is known, select the option **Yes, I know**.

This will activate the configuration keys.

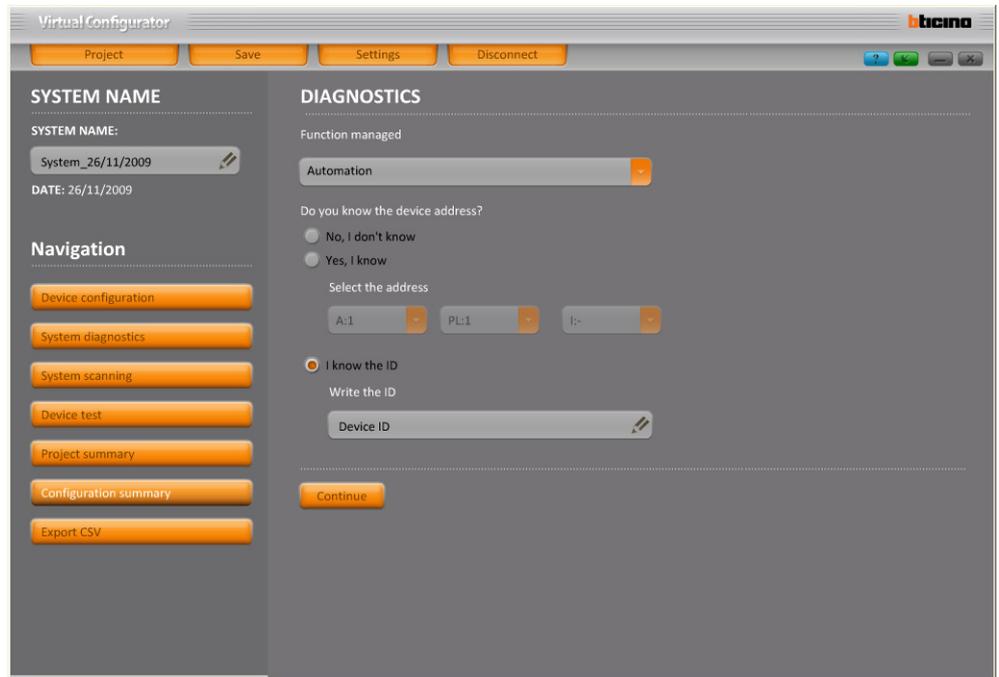

Use the menus of the configurators to enter the current device configuration.

Configurator I refers to the logic expansion interface. It must only be configured if the device is beyond the logic expansion interface.

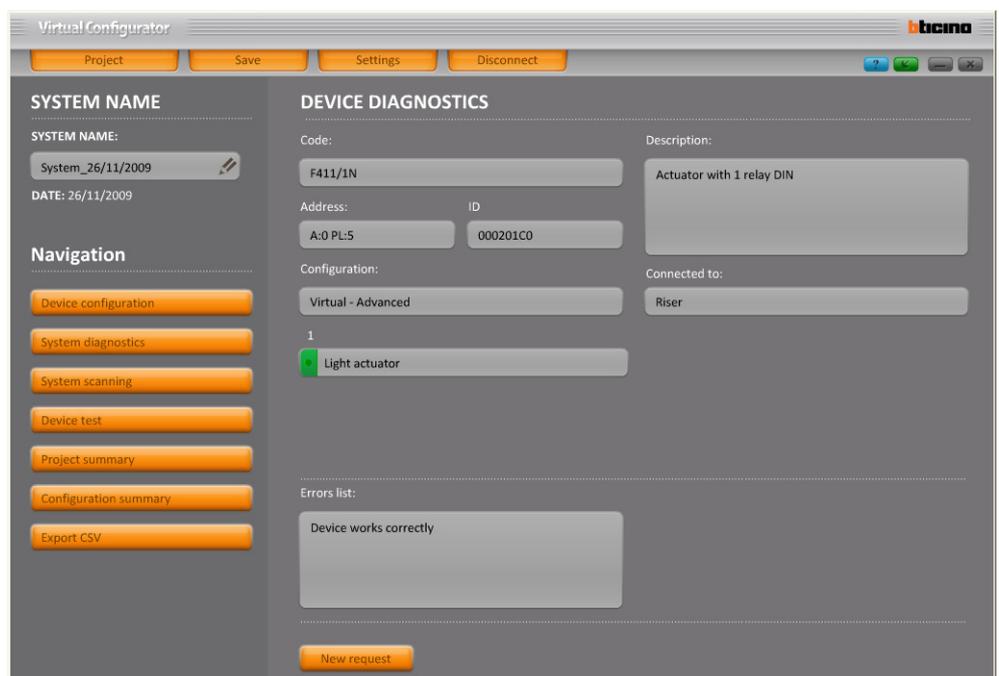

4.1.3 When the device ID is known

To perform the diagnostic procedure on a device which ID is known, select the option **I know the ID**. This will activate the field **Write the ID**, where the ID can be entered.

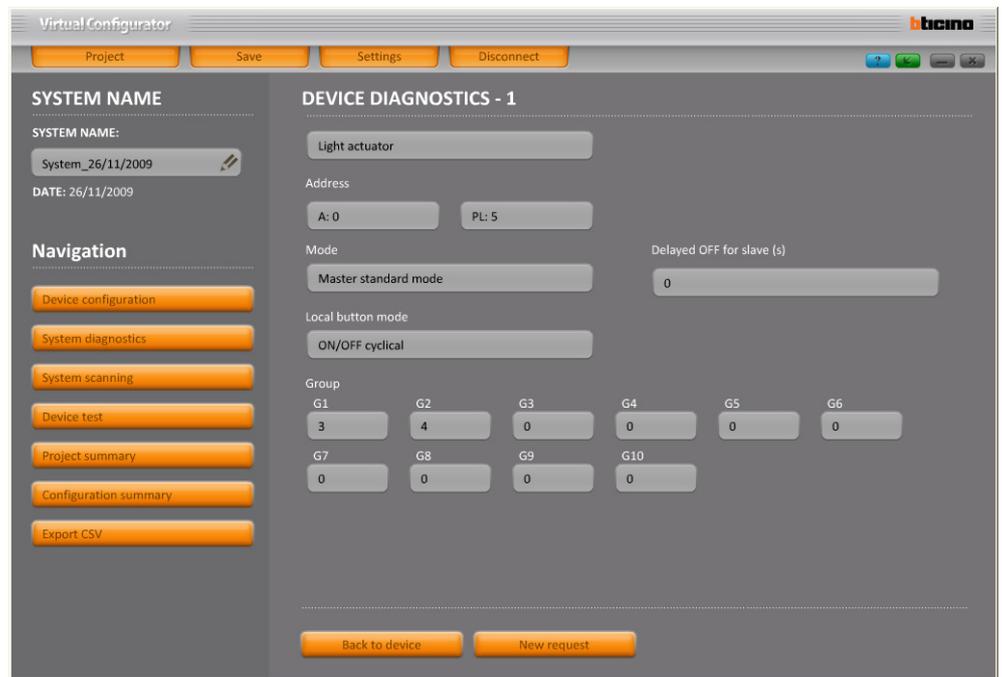

Now, in order to initiate the device identification procedure, both if the ID is known, and if the address is known, click **Continue**.

The following window will open, showing the full description and the corresponding configuration of the identified device. The window also includes a section dedicated to the error list, which shows the device operating status.

If a green icon appears by the side of the device, click the icon with the right mouse button; **the configuration parameters will be displayed, which in this section cannot be changed.**

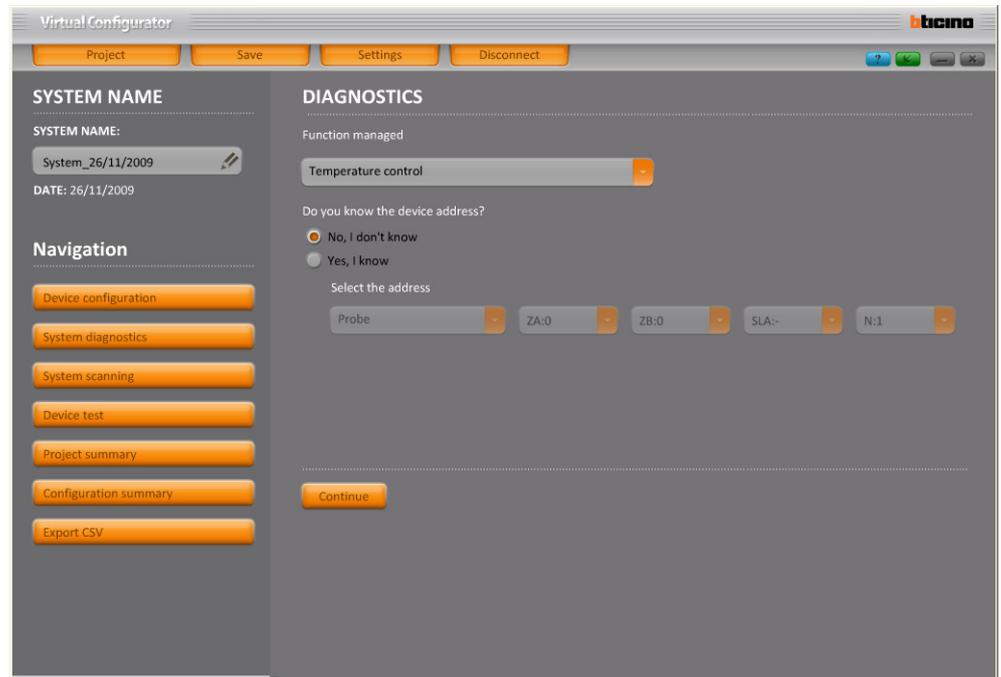

Return to the previous window

Send a new request

4.2 Temperature control Function

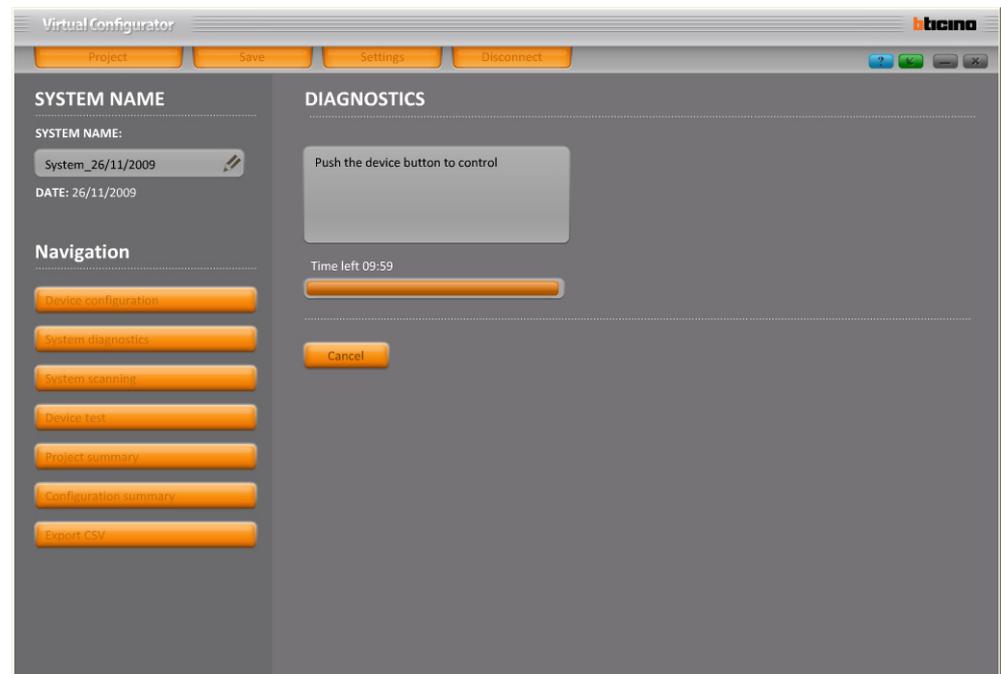

In this window, first of all select one of the following options:

- **no, I don't know** (the address)
- **yes, I know** (the address)

4.2.1 When the device address is unknown

To perform the diagnostic procedure on a device which address is unknown, select the option **No, I don't know**.

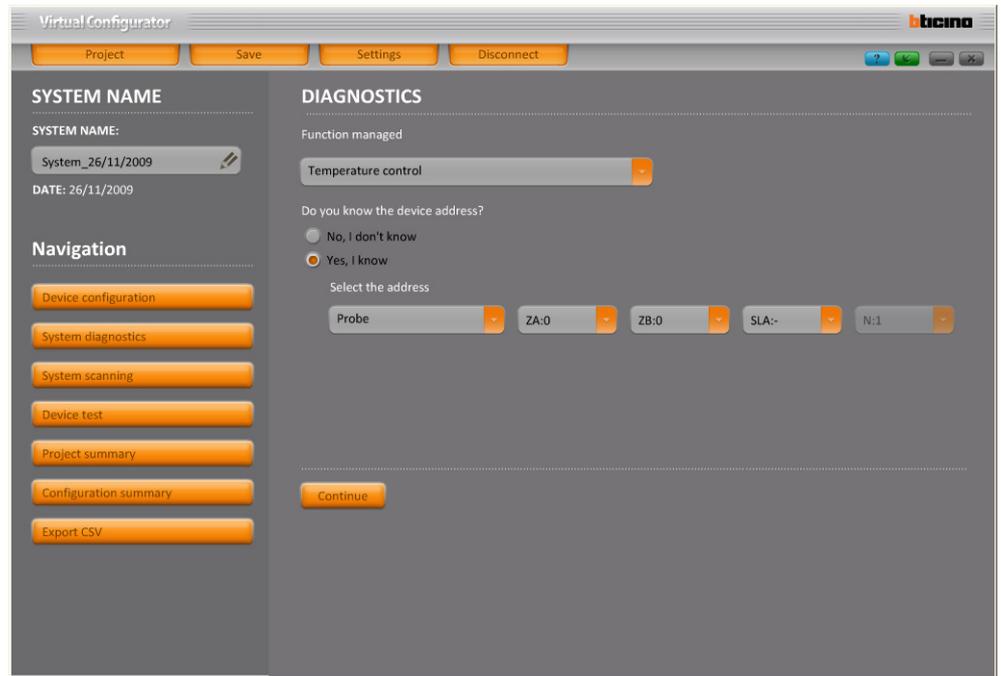

Click **Continue**. The following window will open, where the user will be asked to press a device key within 10 minutes. If this is not done, after 10 minutes an error message will be displayed.

4.2.2 When the device address is known

To perform the diagnostic procedure on a device which address is known, select the option **Yes, I know**.

This will activate the configuration keys.

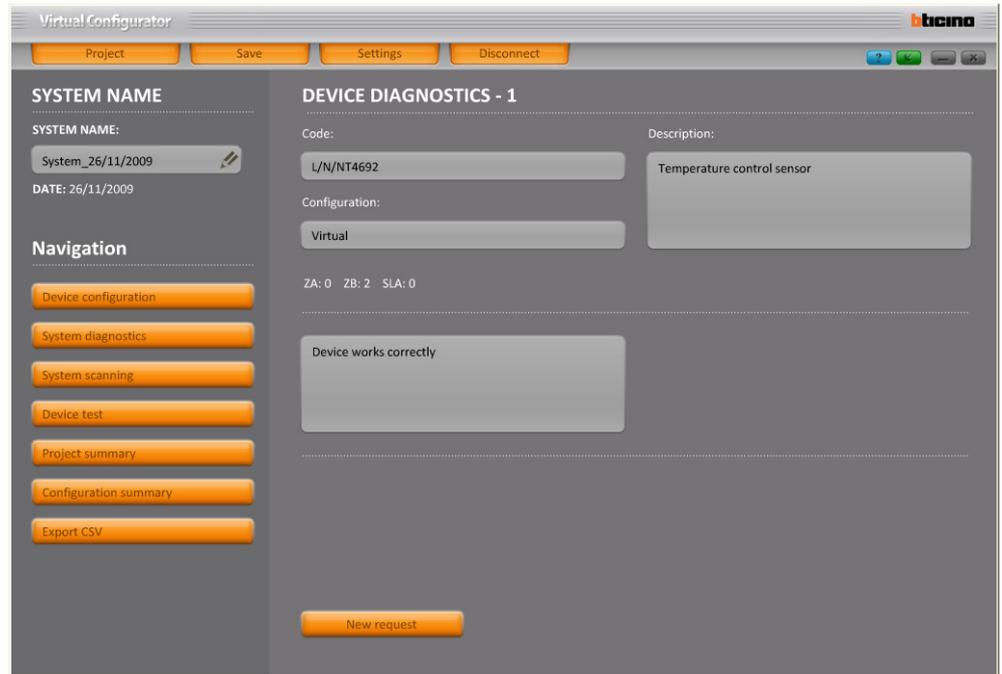

Use the menus of the configurators to enter the current device configuration.

NOTE: the menu of the SLA configurator only becomes active if the device which address is known is a PROBE, while the menu of the N configurator only becomes active if the device which address is known is a GATEWAY or an ACTUATOR.

Now click **Continue** to initiate the procedure for the identification of the device on the system. The following window will open, showing the full description and the corresponding configuration of the identified device. The window also includes a section dedicated to the error list, which shows the device operating status.

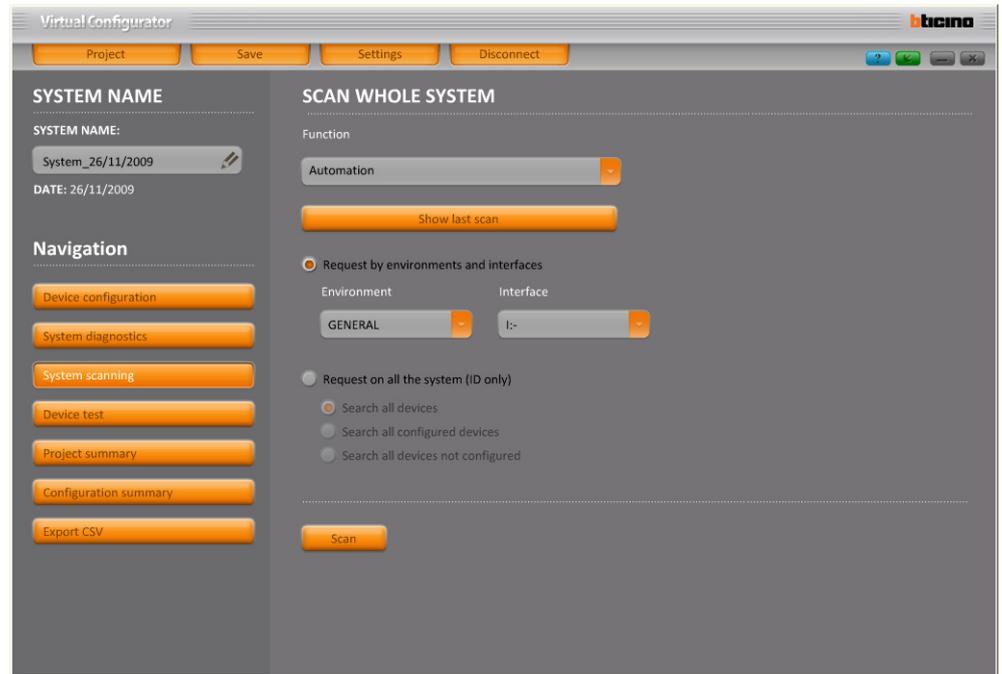

Send a new request

5. System scanning

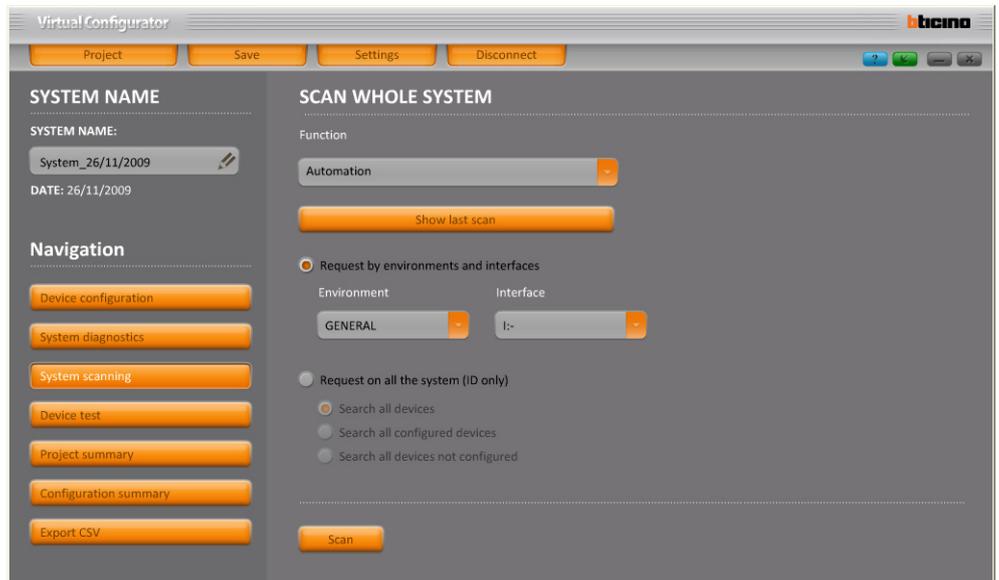

Virtual Configurator can be used to check all the devices installed on the system using the scanning function.

To access the system scanning section click **Scan whole system**. The following window will open, where it will be possible to:

- select the function to manage (Automation or Temperature control)
- display the last scan, by clicking **Show last scan**
- perform the scan

5.1 Automation Function

In this window it is possible to:

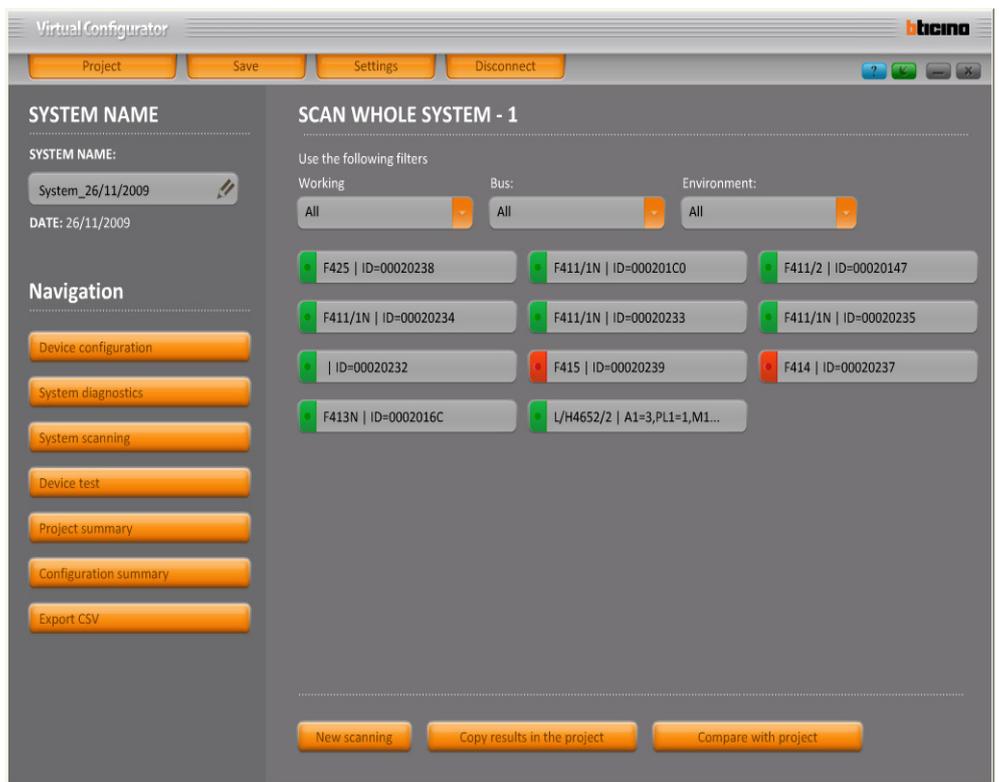

- perform the scan by room and interface
- perform a whole system scan (This type of scan can only be performed if devices with ID are present).

In this case it will be possible to select if to search for:

- all devices
- the configured devices
- the non configured devices

Click **Scan** to start the scanning procedure.

Once scanning is completed, the following window appears, showing the list of all system devices.

NOTE: only when the devices have an ID:
- the software can detect the system devices but not the project devices
- the software can detect the project devices but not the system devices
- the software can detect the devices with a different configuration

New scanning

Return to the previous window

Copy results in the project

It can be used to add the detected devices to the project, or to replace the current project with the scanning results

Compare with project

It can be used to compare the open project with the scan (ID only)

The different colours of the devices indicate the test results:

F413N | ID=0002016C

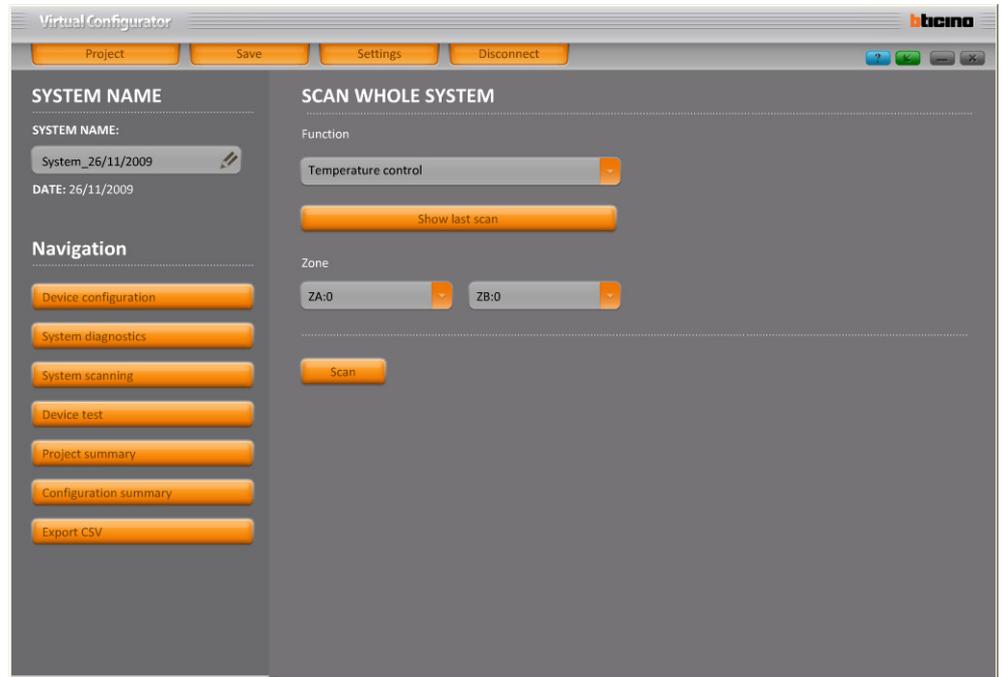

Green - device working

F415 | ID=00020239

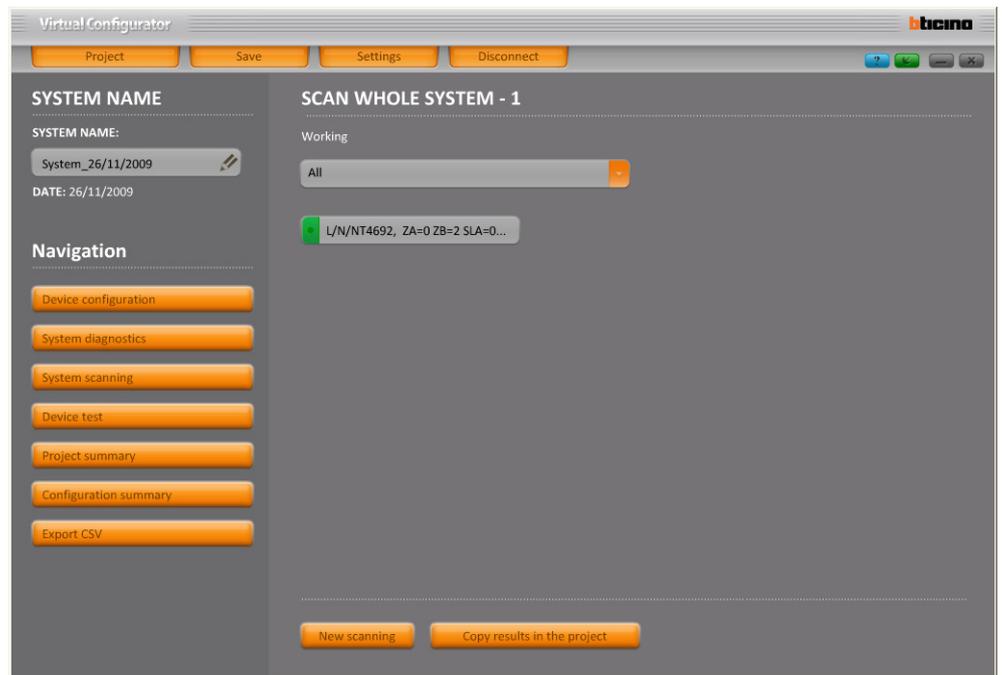

Red - device faulty

Select a single device to know its characteristics and, if applicable, the reasons for the fault.

5.2 Temperature control Function

In order to perform the system scan enter, using the menus of the configurators, the address of the zone on which the scan must be performed. Click **Scan**. The following window will open, listing all the system devices.

NOTE: only when the devices have an ID:

- the software can detect the system devices but not the project devices
- the software can detect the project devices but not the system devices
- the software can detect the devices with a different configuration

New scanning

Return to the previous window

Copy results in the project

It can be used to add the detected devices to the project, or to replace the current project with the scanning results

Compare with project

It can be used to compare the open project with the scan (ID only)

The different colours of the devices indicate the test results:

L/N/NT4692, ZA=0 ZB=2 SLA=0...

Green – device working

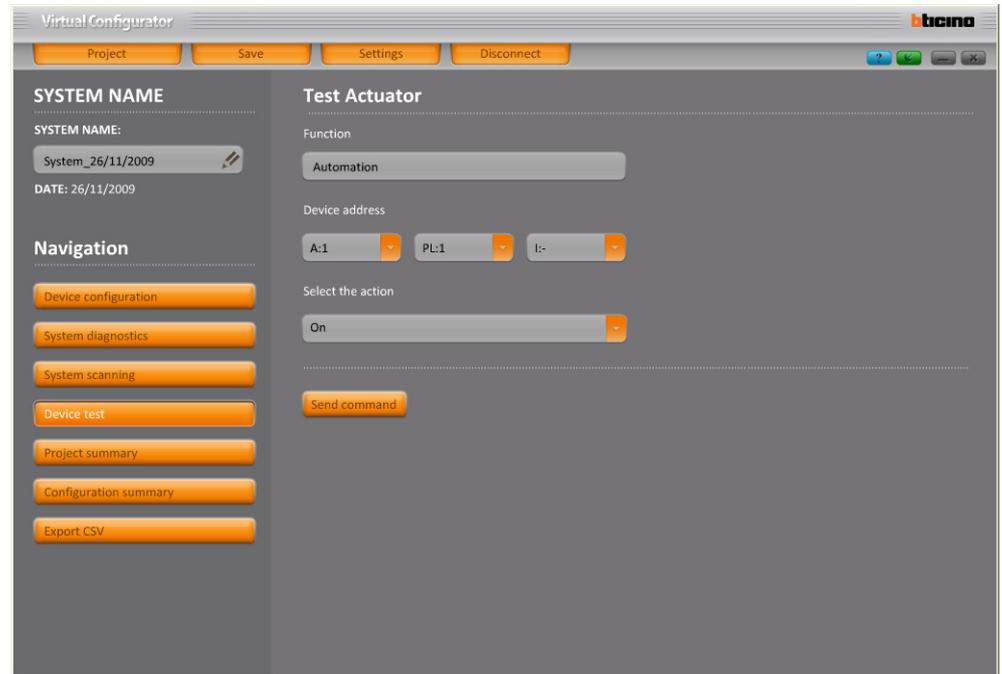

F415 | ID=00020239

Red – device faulty

Select a single device to know its characteristics and, if applicable, the reasons for the fault.

6. Device testing

Virtual Configurator can be used to check the operation of the individual system actuators. Click **Test actuator (device)** to access this section. The following window will appear

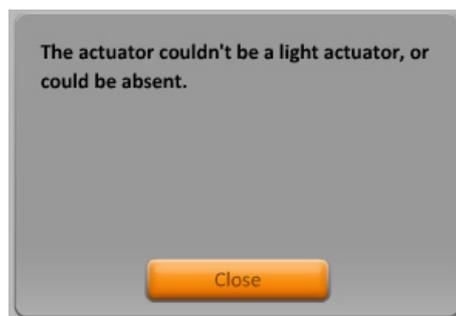

Use the menus of the configurators to enter the address of the device being tested. Based on the type of device, from the window menu select the action to be performed by the device. Then click **Send command**

If the operation is successful, a confirmation message appears.

Click **Close** to return to the previous window, where it will be possible to test another device.

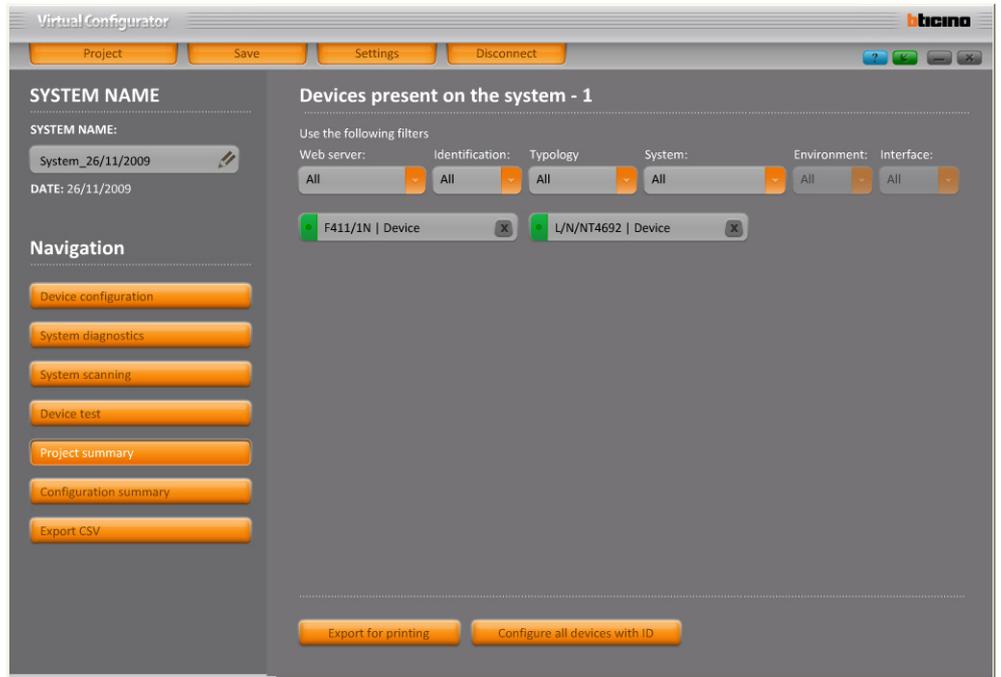

If the device is of the wrong type, or if it is not present in the system, a warning message appears.

Click **Close** to return to the previous window, where it will be possible to retry to perform the operation.

7. Project summary

Virtual Configurator can be used to display the list of devices that make up the system, viewing their individual characteristics and configurations.

To access this function click **Project summary**. The following window will open, listing all the system devices.

It can be used to export the list as a text file for printing

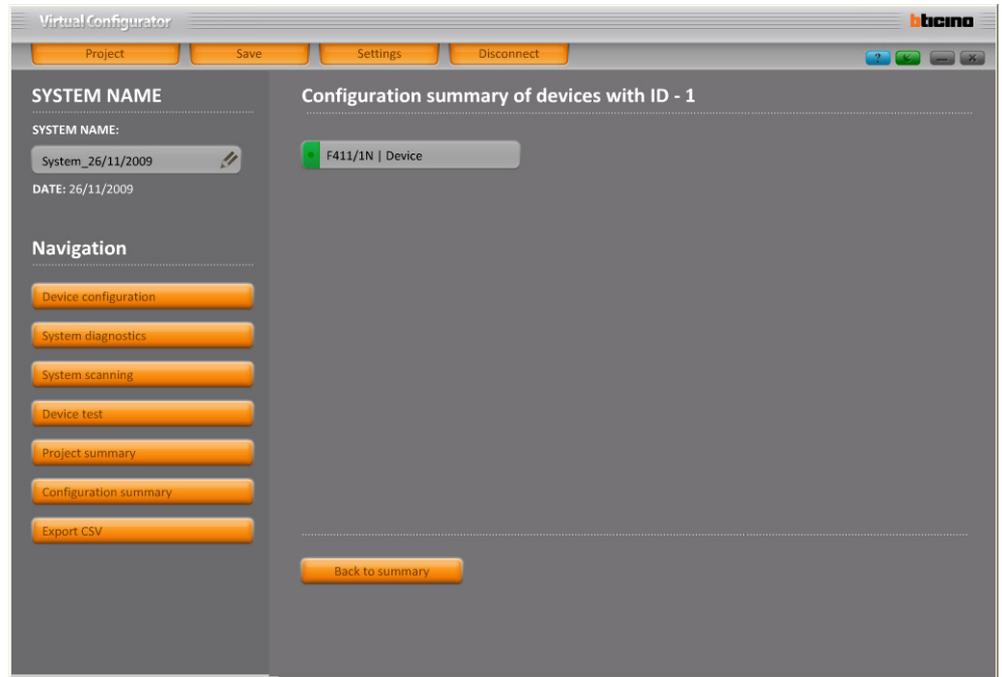

It can be used to configure all the devices with ID.

NOTE: when this icon is clicked, the configuration activates automatically.

8. Configuration summary

Once the configuration of the devices with ID is complete, the **Configuration summary** window opens, showing the list of the devices with ID.

Return to the project summary window

The different colours of the devices indicate the test results:

Green - configuration successful

Red - configuration failed

Grey - the device is not present or has not answered

9. Export to CSV file

This function can be used to export an existing project to a .csv file, which can then be opened using Microsoft Excel.

BTicino SpA
